

ABSTRACT

5 A method for the liquid cleaning of objects via a cleaning liquid that contains at least two components that under first designated conditions form a mixture and under second designated conditions form a solubility gap, contains the following steps:

- establishing the first designated conditions,
- liquid cleaning the objects with the cleaning liquid that is under the first designated conditions,
- establishing the second designated conditions, and
- at least partially separating the contaminations from the liquid under the second designated conditions.
